Lab experiment-26

Experiment 26. Best First Search Algorithm

Aim

To implement the **Best First Search algorithm** using **Prolog**.

Objectives

- To understand heuristic-based search.
- To find a path from a start node to a goal node.
- To select the node with the lowest heuristic value.

Algorithm

1. Define the graph and heuristic values.
2. Set the start and goal nodes.
3. Select the node with the lowest heuristic value.
4. Expand its neighbouring nodes.
5. Repeat until the goal is reached.
6. Display the path.

Flowchart

Code

edge(a, b).

edge(a, c).

edge(b, d).

edge(c, e).

edge(d, goal).

edge(e, goal).

h(a, 4).

h(b, 2).

h(c, 3).

h(d, 1).

h(e, 2).

h(goal, 0).

best_first(Start, Goal, Path)

:-

 search([Start], Goal,
Path).

```
search([Goal|_], Goal,  
[Goal]).
```

```
search([Current|Rest],  
Goal, [Current|Path]) :-
```

```
    findall(H-Next,  
            (edge(Current,  
Next), h(Next, H)),  
            Children),  
    sort(Children, Sorted),  
    get_nodes(Sorted,  
Nodes),  
    append(Nodes, Rest,  
NewList),  
    search(NewList, Goal,  
Path).
```

```
get_nodes([], []).
```

```
get_nodes([_ -Node|T],  
[Node|R]) :-
```

```
    get_nodes(T, R).
```

```
main :-
```

```
    Start = a,
```

```
    Goal = goal,
```

```
    best_first(Start, Goal,  
Path),
```

```
    write('Start: '),  
write(Start), nl,
```

```
    write('Goal: '),  
write(Goal), nl,
```

```
    write('Path: '),  
write(Path), nl.
```

```
:- initialization(main).
```

Output

```
HelloWorld.pl ×
h(b, 2).
h(c, 3).
h(d, 1).
h(e, 2).
h(goal, 0).

best_first(Start, Goal, Path) :-
    search([Start], Goal, Path).

search([Goal|_], Goal, [Goal]).

search([Current|Rest], Goal, [Current|Path]) :-
    findall(H-Next,
        (edge(Current, Next), h(Next, H)),
        Children),
    sort(Children, Sorted),
    get_nodes(Sorted, Nodes),
    append(Nodes, Rest, NewList),
    search(NewList, Goal, Path).

get_nodes([], []).
get_nodes([_Node|T], [Node|R]) :-
    get_nodes(T, R).

main :-
    Start = a,
    Goal = goal,
    best_first(Start, Goal, Path),
    write('Start: '), write(Start), nl,
    write('Goal: '), write(Goal), nl,
    write('Path: '), write(Path), nl.

:- initialization(main).
```

I/O AI Agent

STDIN
Input for the program (Open)

Output:
Start: a
Goal: goal
Path: [a,b,d,goal]

Result

Start: a

Goal: goal

Path: [a,b,d,goal]

Conclusion

Thus, the **Best First Search** algorithm was successfully implemented using **Prolog**.
